I- FUNCTION: G PROTEIN-COUPLED RECEPTOR THAT PROBABLY ASSOCIATES WITH
THE PATCHED PROTEIN (PTCH) TO TRANSDUCE THE HEDGEHOG'S PROTEINS
SIGNAL. BINDING OF SONIC HEDGEHOG (SHH) TO ITS RECEPTOR PATCHED IS
THOUGHT TO PREVENT NORMAL INHIBITION BY PATCHED OF SMOOTHENED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mus musculus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 adjacent, non-overlapping sets. Peptide specific phages were isolated by CC affinity binding to the CD64-covered rods. The specification describes a comethod for the identification of a peptide able to bind specifically to a C target protein. The method comprises displaying the peptide on the CS surface of a replicable display package, synthesising oligopeptides concerned from the target protein on a solid phase, and testing for binding between the peptide and oligopeptides. The method is used to screen large peptide libraries, especially to detect antibodies, or their fragments, that bind to cell markers or that can differentiate between different forms of the same protein, including bispecific antibodies that bind to epitopes on the same monomeric antigen or two non-overlapping epitopes on the same monomeric antigen or two cepitopes on different molecules. The genes/oligonucleotides that encode selected peptides can be isolated and used for recombinant production of antibodies. Selected antibodies are used, e.g. for immunohistochemical or immunofluorescent analysis, and also to detect cell transformation caused to monomeric that in a fartivaccanaes

Three-dimensional structures and models of Fc receptors, useful computer-assisted drug design

in

This amino acid sequence was predicted from the cDNA sequence of cDNA clone p98/X2. It differs from the sequence predicted from clone p135 (see Q211/8) at position 25, p135 encodes a Ser residue while clone p98/X2 predicts a Thr residue. At position 58, p90

New CD53 cell surface antigen and DNA encoding it - for immuno-therapy and diagnosis of haematopoietic neoplasms,

etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human macrophage-specific FcRI receptor encoded by clone p98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R22549 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               an FC receptor protein using various computer programs and models. The products of the invention have anti-inflammatory and immunoprotective activity. This sequence represents the human sFC-gammakI protein fragment described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hypersensitivity, recruitment of inflammatory cells or release of inflammatory modulators. The therapeutic compositions can also be used to treat disease in animals. The knowledge of the 3-D structure of Fc-gamma RIa and models of other FcR provides a means for designing and producing compounds that regulate immune function and inflammation in an animal, including humans (i.e. structure based drug design). For example, chemical compounds can be designed to block binding of immunoglobulin to

                  The amino acid sequence (R91439) of human FCRI was detd. from a CDNA clone, p98 (714718), obtd. from a CDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the FC portion of IgG, normally located on cell surfaces of macrophages. 2 Other cDNA clones, p135 (714717) and p90 (714719),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (see Q21180) predicts Val and p98/X2 predicts Leu. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21 residue hydrophobic membrane spanning domain sequence.
                                                                                                                                                                          Cloning of cDNA encoding cell surface antigen of diagnostic and therapeutic proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cell surface antigen; cloning; immunoselection; therapy; diagnosis; vector; FcRI; Fc receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                R91439

parasitic

surfaces other than macrophages, protein of FcRI and a receptor 1 The present sequence is that of a human macrophage specific PCRI, as deduced from cDNA clone p135 (see A50631), which was isolated from a cDNA library expressed in COS cells using a novel method of the invention designed to isolate CSA nucleic acids. The method is immune-complex disease, amyloidosis, parasitic diseases or multiple sclerosis. FCRI is a high affinity receptor for the FC portion of 19G, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on the control of the control treatment of immune-mediated infections, diseases, and diso animals, including humans. These disorders include asthma, (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the physical selection of cells expressing the antigen by adhesion to the potencies of antibodies or ligand will in therapy. including the diagnosis and in therapy. be helpful and disorders in The method is to increase

At position 58, p90 predicts val while clones p135 and p98/X2 (see Q21179) both predict Leu. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be a close to the contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for the FC portion of IgG, normally located on cell surfaces of macrophages. Another isolated cDNA clone, p90 (T14719), coded for a variant (W00859) of the FCRI sequence, and a third clone, p98 (T14718), coded for an FCRI (R91439) having a different C-terminal sequence. A fusion protein of FCRI and a receptor ligand will be helpful in increasing the potency of antibodies in therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cloning of cDNA encoding cell surface antigen - useful for isolation of diagnostic and therapeutic proteins % \left( 1\right) =\left\{ 1\right\}

FCRI is a high affinity receptor for the Fc portion of IgG, normally located on cell surfaces of macrophages. Other CDNA clones (see also T14717-18) coded for variants (R91438-39) of the FCRI sequence. A fusion protein of FCRI and a receptor ligand will be helpful in increasing the potency of antibodies in therapy

expression libraries is based on transient expression of an antigen by adhesion to an antibedy-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V63444) which allow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  25-FEB-1988;

                                                      This is the amino acid sequence of human Fc receptor I (FCRI), as deduced from cDNA clone p90 (see X07372) isolated using a rapid immunoselection cloning method from a cDNA library expressed in Cells. The cDNA library was constructed from polyA RNA of cells
                                                                                                                                                      New cloning vector and polylinker - based on existing efficient cloning and expression of mammalian cDNA(s), human lymphocyte antigenic sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                      in eukaryotic certs and substrate. The method is useful for adhesion to an antibody-coated substrate which can be expressed and the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V63444) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and immunotherapeutic applications, including the diagnosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13-JUL-1989;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                01-DEC-1992;
25-FEB-1988;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   were also obtained. A novel method for cloning cDNAs from mammalian expression libraries is based on transient expression of an antigen in eukaryotic cells and selection of cells expressing the antigen by adhesion to an antibody coated substrate. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           from a single patient undergoing extracorporeal interleukin-2 induction therapy. ```
role in defending the body against infections. First, pathogens are opsonised by serum immunoglobulins. The resulting complex then binds to cells expressing Fc receptors. FcgammaRI molecules are expressed by monocytes and macrophages, but expression can also be induced on neutrophils and eosinophils. Upon Fc receptor activation, immune effector pathways are activated, leading to immune response. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    glycosylation, cancer
                                                                                                                                   may be modified to produce recombinant versions. The recombinant Fc receptor consist only of the extracellular portion of the receptor and are not glycosylated i.e. they do not have transmembrane domains or signal peptides. The recombinant proteins may be used in immunoassays t determine the immune status of patients with chronic diseases of the immune system, e.g. AIDS, systemic lupus erythematosus (SLE), multiple myeloma (MM), or rheumatoid arthritis. In addition, pharmaceutical
